

# How to make pretty labels on Slicer

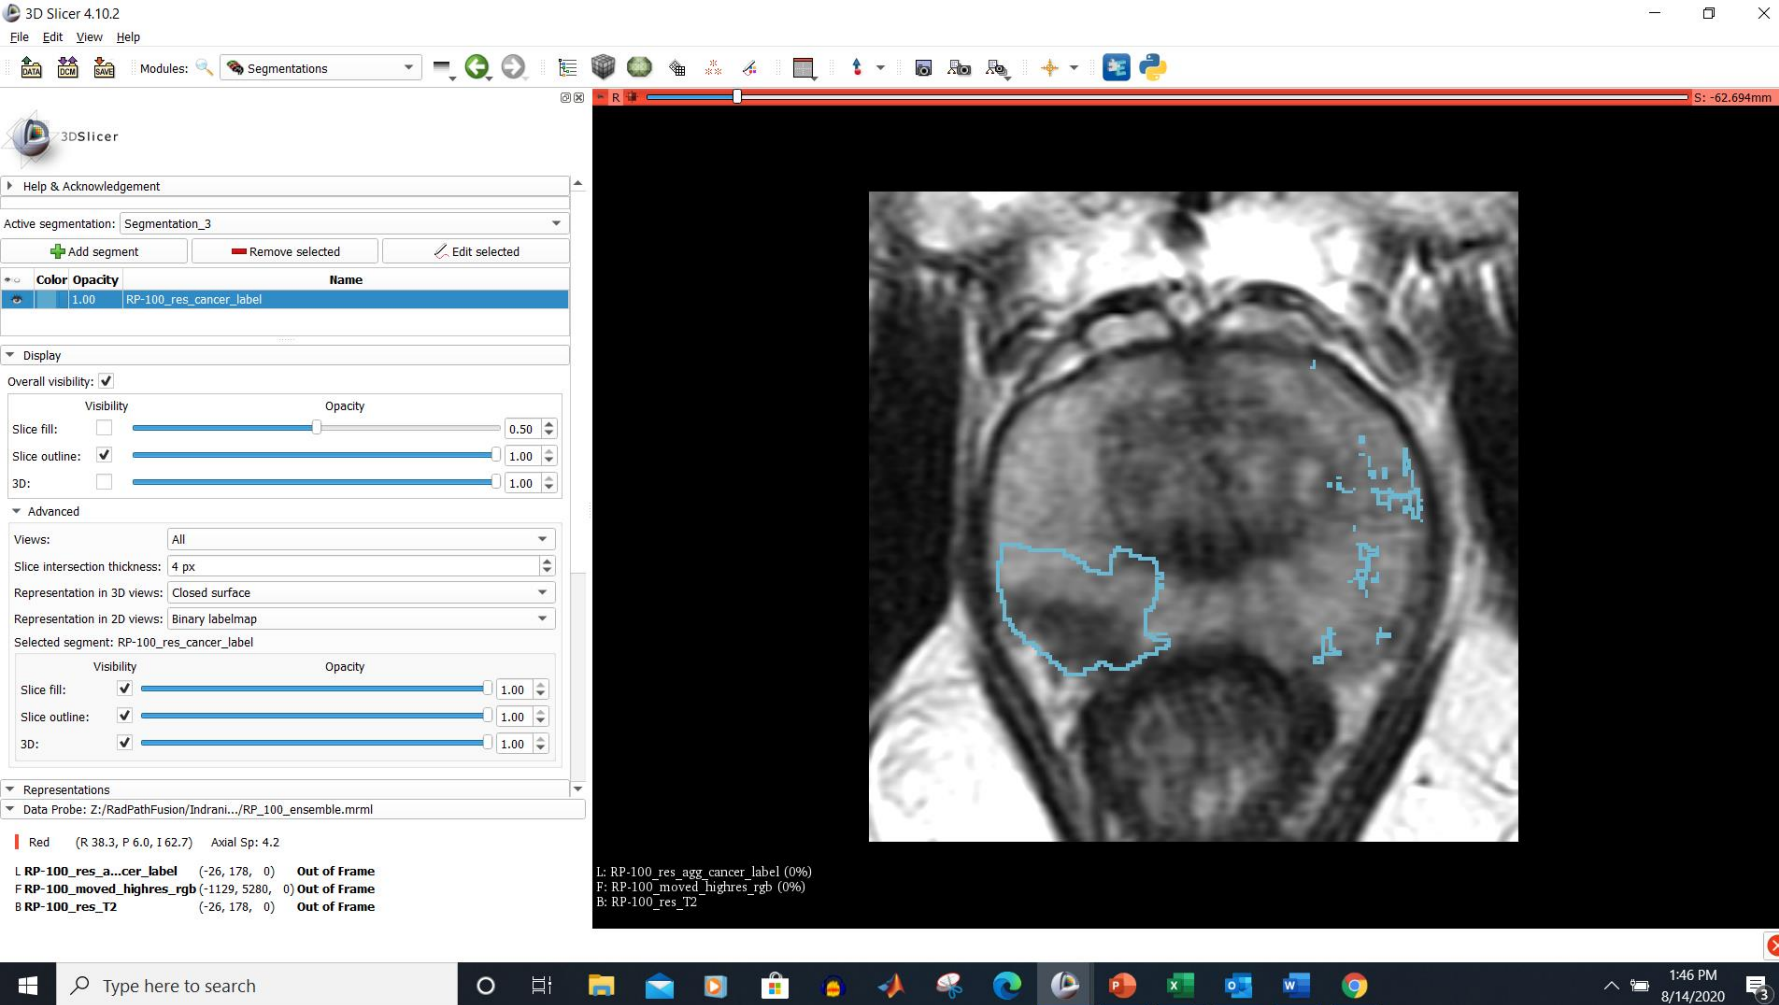

- Go to Segmentations → Create new segmentation

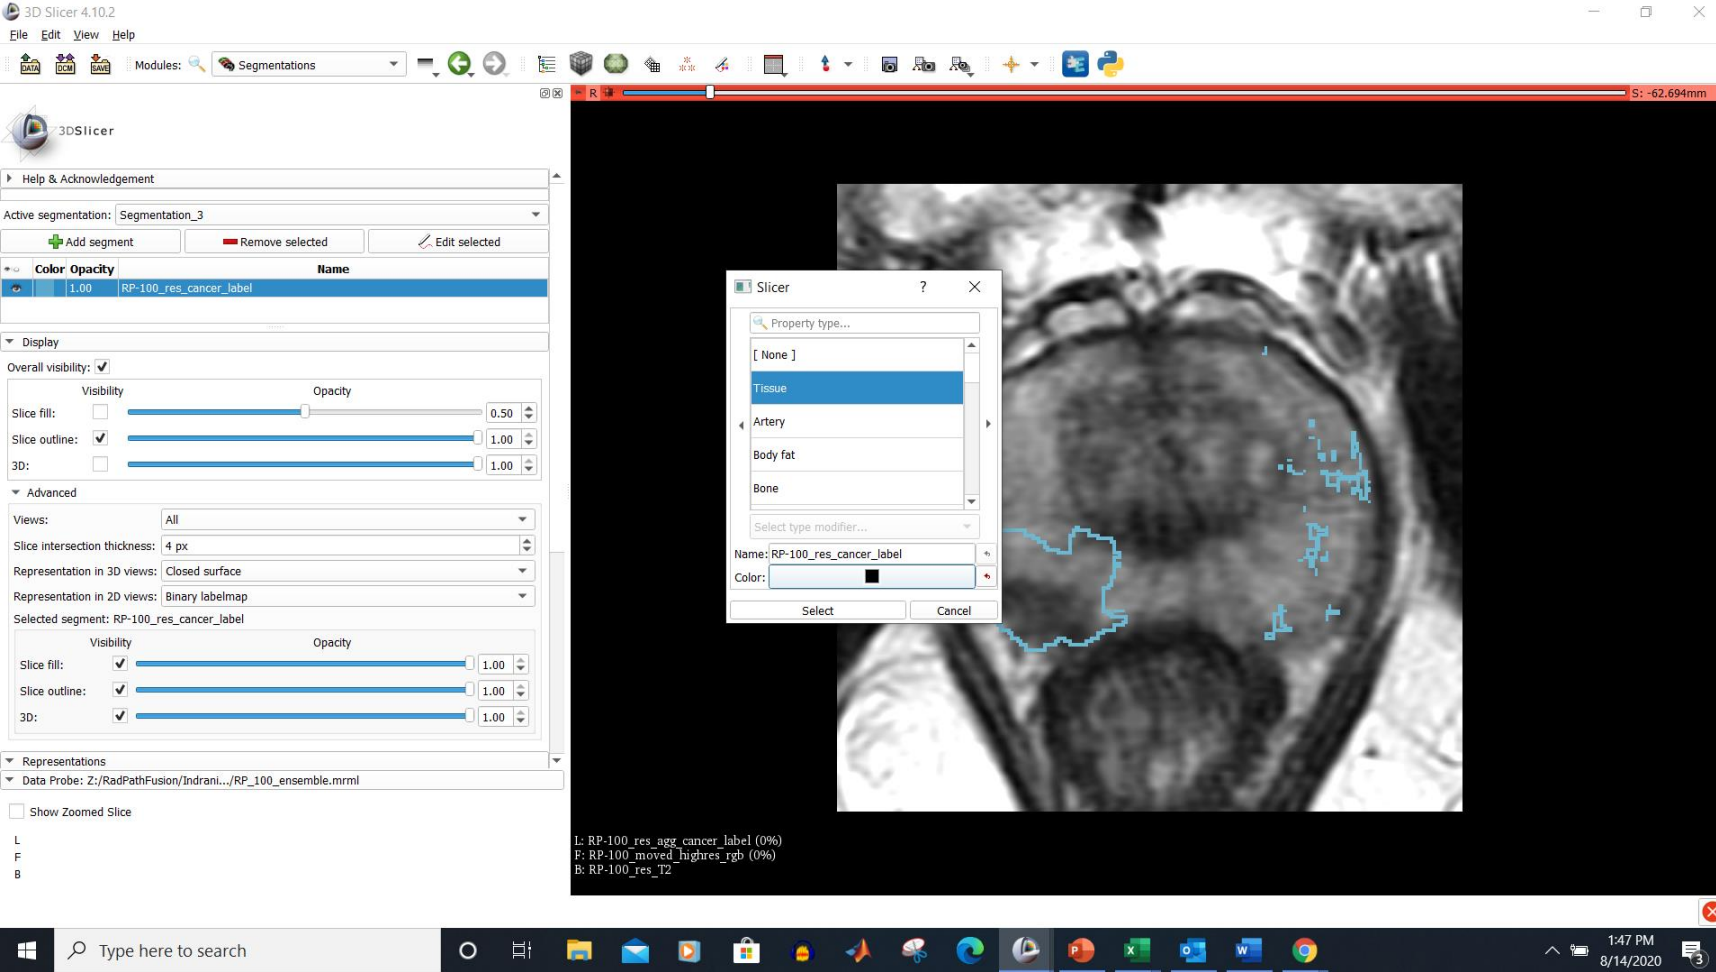

- Go to Export/Impot modules → Import → [your cancer label] → Import

- After importing cancer label, it will look like this.

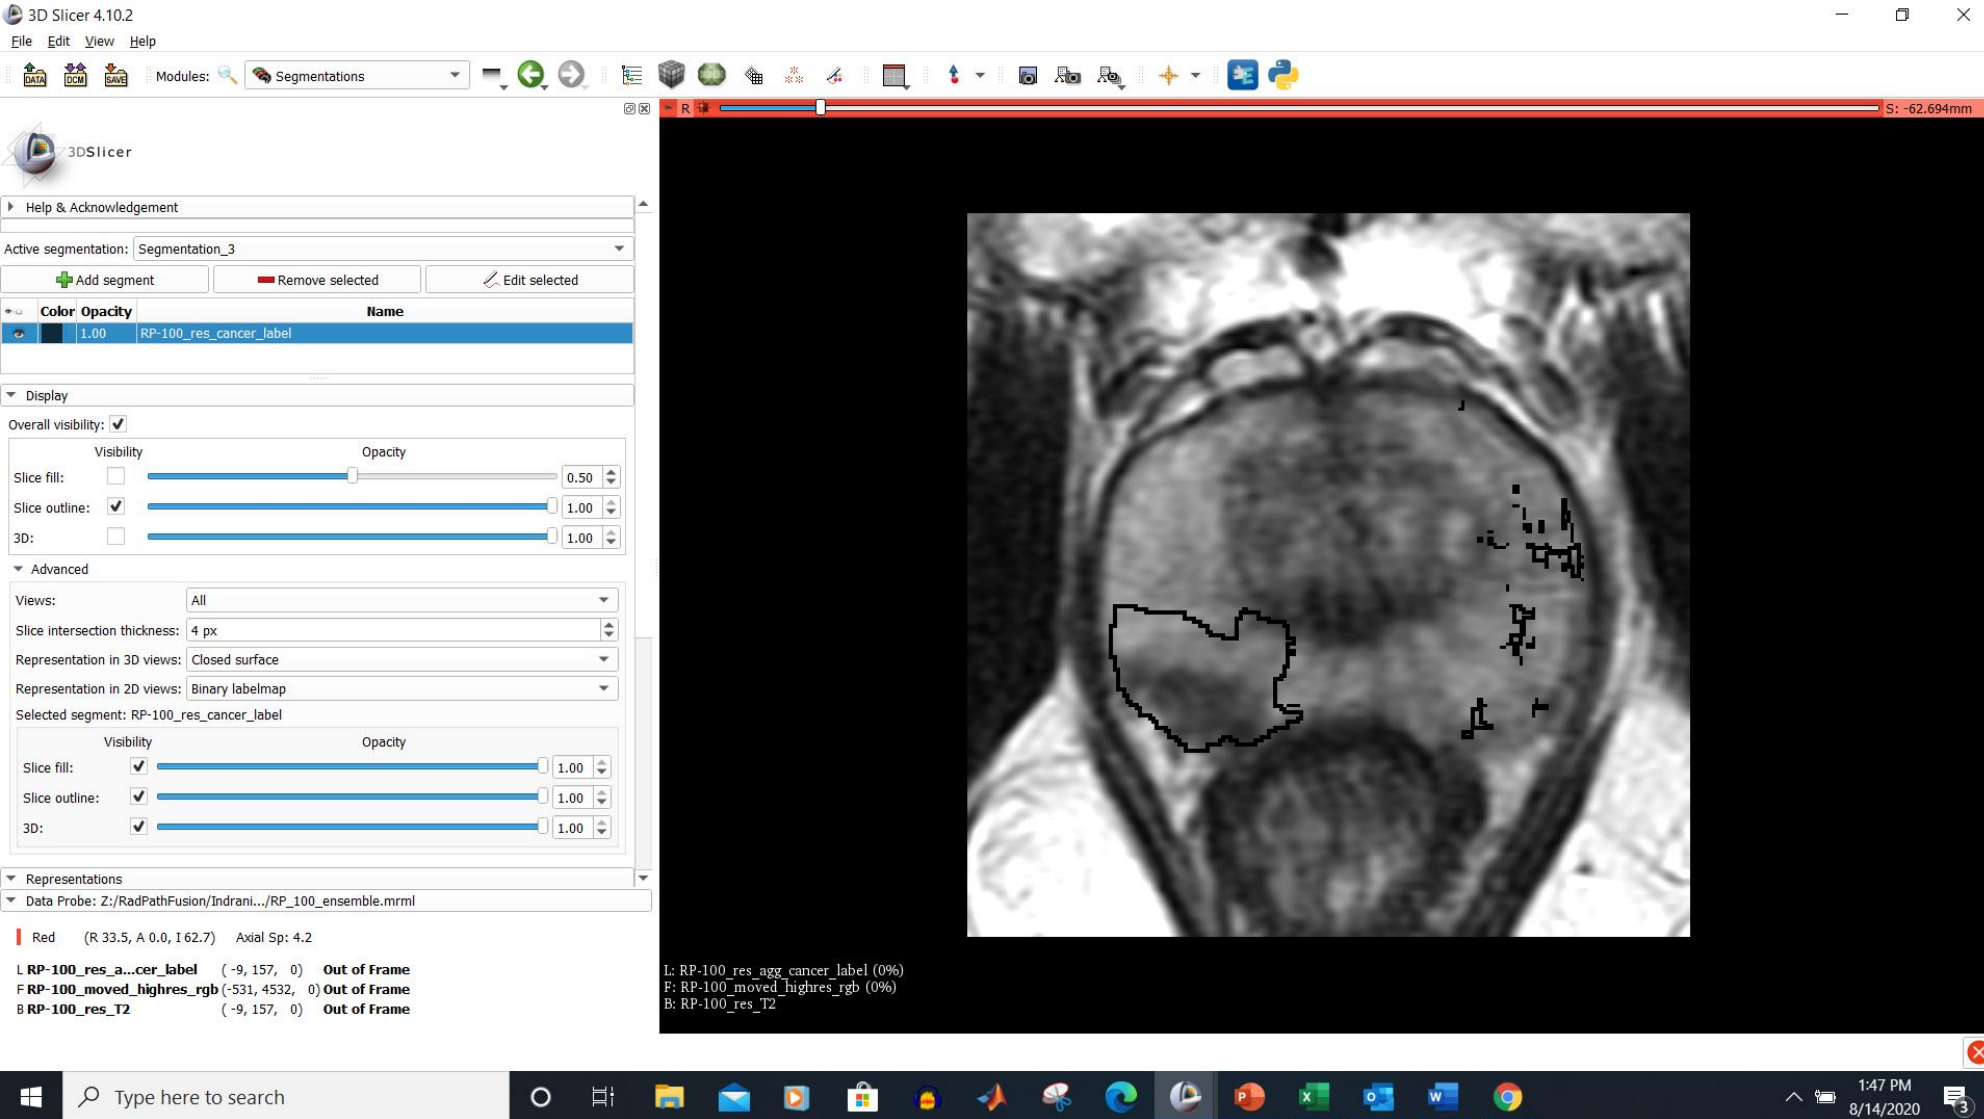

- Uncheck slice fill and 3D.
- Under Advanced, increased Slice intersection thickness (here it is 4px).

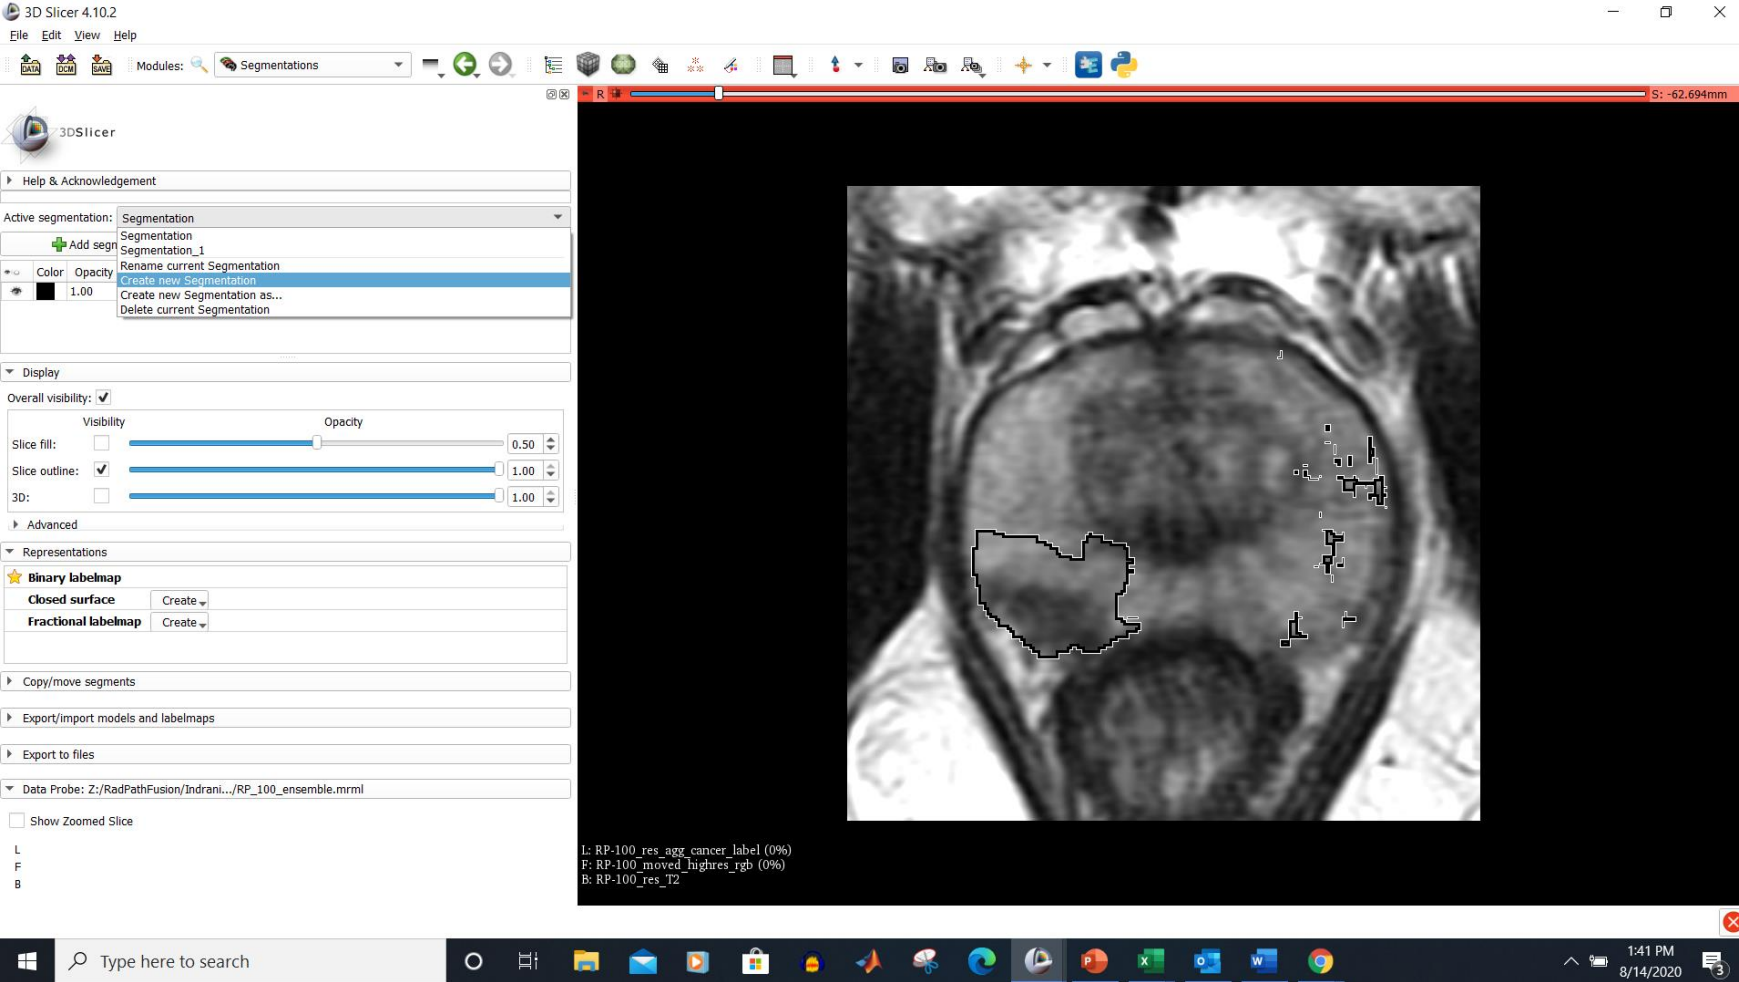

- Under color opacity, change color to black.

- It will look like this.

- Follow same steps to make another cancer label outline with everything same, except color as white and thickness as 1px. This helps in highlighting the black outline.
- Final image will look like this.
